

PushApp — Feature Roadmap across 5 Versions

Every remaining feature ranked into five versions, with the reasoning for each placement. Draft for approval — I'll fold it into **Version_Roadmap.md** once you sign off.

● V1 · POC

● V2 · MVP

● V3 · Commercial

● V4 · Scale / Ecosystem

● V5 · Future / Optional

Feature	What it is	Version	Why this version — and not earlier / later
V1 · POC — validate: does social + Buddy drive persistence?			
Journey creation (basic)	Build a Journey: name, rhythm, a few Steps, a Starter Step, and your "why".	V1	Core substrate — nothing can be tested without it. Kept deliberately minimal (no Phases, no full types yet).
Check-in loop + Home	Report a Step done; Home shows the prioritized "what to do now".	V1	The fundamental engagement loop the POC measures. Everything else is scaffolding around it.
Evolving Buddy	Companion that reacts to check-ins, evolves with progress, and celebrates completions.	V1	The Buddy half of the hypothesis. Can't be deferred — it's half of what we're validating.
Social support (Allies + cheer)	Add friends; chosen Allies see your progress and cheer/nudge; you see theirs.	V1	The social half of the hypothesis — the differentiator itself. The whole POC exists to test this + Buddy.
Coin economy + Shop (shallow)	Earn coins from check-ins/missions; spend on Buddy cosmetics.	V1	Makes the Buddy loop rewarding → part of persistence. Shallow (coins only, small set) to avoid building a full economy prematurely.
Missions + Login rewards (shallow)	Daily/weekly missions and a daily-login reward that grant coins.	V1	The return-loop driver that feeds the Buddy economy. Kept minimal — a few mission types only.
Basic reminders	Simple time/day scheduled nudges.	V1	Minimum needed to support follow-through. No AI required — adaptivity comes later (V2/V3).
V2 · MVP — the smallest product you'd adopt solo and keep for months			

Feature	What it is	Version	Why this version — and not earlier / later
Explore + starter Journey library	Browse and adopt ready-made Journeys, not only build from scratch.	V2	Solves the cold-start "blank page" that blocks solo adoption. Unnecessary just to validate persistence, so it waits until V2.
Onboarding (egg → hatch)	A real first-run flow, including the Buddy hatching moment.	V2	First impressions matter for a real product; a scrappy POC can start rougher.
Phases + full Journey types	Optional Phases + frequency / completion / avoidance / critical-compliance / hybrid.	V2	Real Journeys need richer structure. The POC used only simple types to stay thin.
Light AI encouragement	Personalized nudges generated from the user's "why" answers.	V2	Enhancement that shows differentiation and degrades gracefully (D2). Not needed to prove the core loop, so not in V1.
Smarter-timed reminders	AI improves <i>when</i> reminders fire, vs V1's fixed times.	V2	A light, graceful AI upgrade over V1. Full multi-signal adaptivity is deliberately held for V3.
Completion celebrations + states	Journey-completion moments; return-to-life and empty states.	V2	Polish expected of a shippable product. A POC can skip the finish.
Grace Tokens (minimal)	Earned grace to skip/postpone a Step without breaking the Journey, with a brief reason capture (Bible §36).	V2	Directly attacks the miss→quit churn the whole product is fighting. Kept minimal here (earn + reason); the richer system waits for V3.
V3 · Commercial — the first polished, paid version			
Adaptive Intervention Engine	Multi-signal nudges: time, location, missed-streak recovery.	V3	A core differentiator but heavy to build. MVP keeps smarter reminders only; the full engine earns its cost once users are paying.
Weekly-planning flow	Start-of-week "approve / edit your plan" screen.	V3	Helps persistence but isn't essential to first adoption — founder deferred it out of the MVP.

Feature	What it is	Version	Why this version — and not earlier / later
AI Buddy-drafts-your-Journey (paid)	Buddy generates a full Journey draft and refines it in conversation.	V3	The paid wedge. Built when monetization is the question — not before there's something to charge for.
Achievements wall	Medals with unlock conditions and a detail sheet.	V3	A status/retention layer, not core value. Polish for a paid product; deferred from POC/MVP.
Deeper economy	Second currency (gems), richer Shop, offers / "purchases-left".	V3	Monetization depth — only worthwhile once there's a paying audience. POC/MVP stay on a single shallow currency.
Buddy customization depth	Clothing, items, location, and furniture categories.	V3	Expands the identity/collection loop — commercial-grade polish beyond the POC's small cosmetic set.
Broader Ally types + Support Circle	Support beyond friends-only.	V3	More reach but more moderation/complexity. POC/MVP stay friends-only by decision.
Community Insights + reviews	Anonymized "what worked" wisdom and Journey reviews.	V3	Needs a real user base to be meaningful — impossible to validate at POC scale.
Journey Template foundations	Reusable, shareable Journey templates.	V3	Precursor to the Marketplace; a commercial-stage building block.
Subscription / monetization	Paywall, tiers, billing.	V3	By definition, this is what makes V3 the "commercial" version.
Grace Tokens (full system)	Gifting from Allies, per-Journey flexibility policy, regenerating floor + earned top-ups, and Buddy/personalization adaptation from the captured reasons.	V3	The social (gifting) and personalization (reason→adaptation) depth needs a real user base and the AI engine — so it follows the minimal V2 version.
V4 · Scale / Ecosystem — the platform & the moat			

Feature	What it is	Version	Why this version — and not earlier / later
Full Marketplace + Creator economy	Creators publish, monetize, and have profiles (Explore "Top creators").	V4	The platform & moat. Needs a commercial base and content supply first, so it follows V3.
Business Journeys	Brands publish content (Explore "From brands").	V4	A B2B/ecosystem layer that follows the creator marketplace.
Rich Step Types system (§35)	Video, audio, quiz, reflection, meditation, PDF, slides, AI-conversation, in-app exercise Steps.	V4	Unlocks courses/coaching/creator content. A big Journey-Engine change that pays off precisely alongside the ecosystem.
Full dynamic Intervention Engine (JITAI)	The mature adaptive system across many signals.	V4	The grown-up version of V3's engine — needs data and scale to be worth it.
AI-generated personal roadmaps	AI assembles whole multi-Journey growth plans.	V4	Advanced, trust- and data-dependent. Approaches the vision — sits at the ecosystem stage.
V5 · Future / Optional Directions — exploratory; a home for new ideas			
Interactive Journey Experiences	Gratitude / NLP / guided in-app exercises as first-class experiences (§5A.7).	V5	Exploratory; shape still uncertain. An optional direction rather than a committed release.
Buddy voice & conversations	The Buddy speaks and holds real conversations.	V5	Far-future and speculative — heavy AI + design bets; validate the fundamentals first.
Competition Mode	Friendly competition mechanics (§31).	V5	Optional and risky — must be balanced against the no-shame principle. Test much later, if at all.
Advanced psychological personalization	Deep behavioral / psychological modeling.	V5	Research-heavy and long-horizon; depends on years of data and trust.
New future ideas (open bucket)	A holding place for additional ideas as they arise.	V5	Where fresh "someday" ideas land before they're staged into a concrete version.

Investor-vision emphasis lives in V4–V5 (Marketplace, Business Journeys, Rich Step Types, adaptive AI, Buddy conversations). Nothing here is cut — later versions defer, they don't delete (per Product_Roadmap_and_Scope.md).
